

Optimized Workloads

The company needs to optimize replication workloads to save system resources and monitor activity.

The company uses traditional ETL tools, but the number of concurrent workloads is getting out of hand and the systems are starting to have problems with the number of workloads running.

Why use Adoki?

Resource Manager & Monitoring

- Resource pools and time locks can be defined for each system.
- Adoki takes resource pools into account and optimizes workloads.

Runs directly on the big data platform

- Adoki can be deployed as a module on existing platforms, which reduces hardware requirements.

Load statistics

- Adoki provides detailed statistics on resource consumptions, so workloads can be optimized.

Metadata repository

- Adoki metadata can be exported and used by additional tools via the REST API.
